

BotTool, Audio Services, Germany

Case study

About project

Industry

Audio Instrument Service Provider

Technology

JSP, Servlet, MySQL, jQuery, Quartz Scheduler

Expertise Delivered

Crawler System

BotTool it's a one type of admin dashboard. By this web portal admin can Add/update/delete Scheduled for fetch products from other site, price comparison and set new value for product, can see founded new products, see and resolve Errors while fetching products, Crawl site management, Review while Scheduling, automatic email sending, Download products etc...

Objectives

- › A main goal of this application is, User can get almost perfect analysis report of current market trend against listed out projects
- › User can track the price of every product which are listed out
- › Based on current trend, we can up and down product prices
- › Frequently we can monitor prices with markets
- › Such application is separate than actual project so it will not impact with actual web portal.
- › User can manage list of other sites/portal which are market comparators

Key Features

- › Such application was designed for intranet so there's no any security issue
- › Secured. Based on user role.
- › Only user can manage other sites/portal which we can add from main page
- › Many modules like, Session management, Price comparison, Add new products, Notifications, Site managements

Benefits

- › This application will provide runtime accurate data from other sites/portals
- › Used proxies to avoid further issues
- › User can easily monitor all projects along with other comparators
- › If prices are difference then auto notifications will be sent to appropriate admins
- › User can manage frequencies of crawling cycle
- › Error tool will provide detail level log which can help to make this application in terms of perfect.
- › User can manage sites/portals from this portal.
